EXECUTIVE ANALYTICS CAPSTONE

Customer Churn: Where should the team act first?

Decision brief | Data Analytics Task 4 | Fictional sample dataset

CUSTOMERS	CHURNED	OBSERVED CHURN RATE
15	7	46.7%

Executive recommendation

Run a small, measured retention pilot focused first on customers with 4+ support tickets and customers on month-to-month contracts, especially those in their first 12 months. Offer proactive support and investigate recurring issues before testing any discount or contract-conversion offer.

Important: the dataset contains only 15 synthetic customer records. Results are descriptive signals for a pilot, not reliable forecasts of real-world churn or proof that any factor causes churn.

Five decision-relevant insights

1. Overall churn is high in this tiny sample

7 of 15 customers churned (46.7%). This is a sample description only; it should not be treated as a population estimate.

2. Month-to-month contracts stand out

All 7 month-to-month customers churned (7/7), while none of the 8 one-year or two-year contract customers churned. The contrast is striking but based on very small groups.

3. Support burden is a useful triage signal

All 5 customers with 4+ support tickets churned (5/5); none of the 6 customers with 0–1 tickets churned (0/6). Check whether unresolved or repeated issues are driving dissatisfaction.

4. Early-tenure customers appear more vulnerable

All 6 customers with 12 months or less tenure churned (6/6); 1 of 5 customers with 13–24 months churned, and 0 of 4 with 25+ months churned. Validate with a larger cohort.

5. Basic subscriptions have more churn in this sample

5 of 7 Basic customers churned (71.4%), compared with 2 of 4 Pro customers (50%) and 0 of 4 Enterprise customers. Subscription type overlaps with contract and tenure, so do not assume it is the cause.

Data quality and interpretation

The supplied CSV has 15 rows and 11 columns. No missing values or exact duplicate rows were detected. CustomerID is the identifier (not a metric). The file columns differ from the accompanying field guide: this CSV uses TenureMonths, MonthlyCharges, ContractType, SupportTickets and Churn, plus demographic/payment/subscription fields. The sample does not include a timestamp, observation window, intervention costs, customer lifetime value, or evidence of causal relationships. Check ranges and business rules with the data owner before operational use.

Recommended action plan and impact framing

When	Action	Success measure
Weeks 1–2	Review recent support cases for customers with 4+ tickets; contact them with issue resolution help.	Contact rate; issue resolution; repeat tickets
Weeks 1–2	Offer onboarding/check-in to month-to-month customers in first 12 months.	Reach rate; activation; support satisfaction
Weeks 3–6	Run a small holdout or randomized pilot where practical; compare contacted vs. similar non-contacted customers.	Churn rate difference; cost per retained customer
After pilot	Scale only if measured retention benefit exceeds the cost and results repeat.	Incremental retained customers; net value

Expected impact: scenario-based, not a promise

Because no intervention effectiveness, margin, or customer lifetime value is supplied, a defensible rupee impact cannot be calculated yet. For planning only, if a pilot contacts 5 high-ticket customers and prevents churn for 1 of them, that would mean 1 additional retained customer in the pilot. If 2 of 5 are retained, that would mean 2. These are illustrative scenarios, not predicted outcomes. Record the actual comparison group result and intervention cost before claiming impact.

Decision owner: subscription/customer-success lead. Decision: authorize a limited retention pilot, not a full rollout. Uncertainty: extremely high due to n=15 synthetic records and overlapping customer characteristics. Next measurement: compare churn over a defined follow-up period for contacted and comparison customers, alongside resolution rate and cost.

Suggested presentation close

“The sample points to a practical place to investigate first: high support-ticket volume, month-to-month contracts, and early tenure. We recommend a low-cost, measurable pilot—not assuming these patterns prove causation. We will scale only if follow-up data shows a repeatable reduction in churn at an acceptable cost.”
